FUNCTION: NECESSARY FOR EFFICIENT RNA POLYMERASE TRANSCRIPTION ELONGATION PAST TEMPLATE-ENCODED ARRESTING SITES. THE ARRESTING SITES IN DNA HAVE THE PROPERTY OF TRAPPING A CERTAIN FRACTION OF ELONGATING RNA POLYMERASES THAT PASS THROUGH, RESULTING IN LOCKED TERNARY COMPLEXES. CLEAVAGE OF THE NASCENT TRANSCRIPT BY CLEAVAGE FACTORS SUCH AS GREA OR GREB ALLOWS THE RESUMPTION OF ELONGATION FROM THE NEW 3'TERMINUS. GREA RELEASES SEQUENCES OF SIMILARITY: BELONGS TO THE GREA/GREB FAMILY.

physically assigned Pl and TAC clones.";

DNA Res. 5:203-216(198).

-!- FUNCTION: RECCONIZES AND BINDS THE THETHYLGUANOSINE-CONTAINING

MENA "CAP" DURING AN EARLY STEP IN THE INITIATION OF PROTEIN

SYNTHESIS AND FACILITATES RIBGOOME BINDING BY INDUCING THE

CONTAINING OF THE MRAAS SECONDRAY STRUCTURES (BY SIMILARITY).

-!- SUBUNIT: EIF4F IS A TRIMER COMPOSED OF EIF4E, BIF4G AND EIF4A

(WHICH CAN CYCLE IN AND OUT OF THE COMPLEX). IN HIGHER PLANTS TWO

ISOPORMS OF EIF4F HAVE BEEN IDENTIFIED, NAMED EIF4F AND

EIF(ISO)4F: EIF4F HAVE BEEN IDENTIFIED, NAMED EIF4F AND

EIF(ISO)4F: EIF4F HAVE GREVENTY PLANTS TWO

-!- SIMILARITY: BELONGS TO THE EUKARYOTIC INITIATION FACTOR 4E FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Eukaryota, Viridiplantae, Streptophyta, Embryophyta, Tracheophyta,

Submitted (NOV-1997) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: PROBABLY PART OF A HIGH-AFFINITY BINDING-PROTEIN-
-!- FUNCTION: PROBABLY SYSTEM FOR NITRATE. PROBABLY RESPONSIBLE FOR DEPRENBENT TRANSPORT SYSTEM FOR THE TRANSPORT SYSTEM.
-!- SUBCELLULAR LOCATION: Membrane-associated (Potential).
-!- SIMILARITY: BELONGS TO THE ABC TRANSPORTER FAMILY.
                                                                                  Gaps

Ishizuka M., Imai H.;

Submitted (AUG-1994) to the EMBL/GenBank/DDBU databases.

-1- FUNCTION: PRODUCES ATP FROM ADP IN THE PRESENCE OF A PROTON
GRADIENT ACROSS THE MEMBRANE. THE GAMMA CHAIN IS BELIEVED TO BE
IMPORTANT IN REGULATING ATPASE ACTIVITY AND THE FLOW OF PROTONS
THROUGH THE CF(0) COMPLEX.

-1- CATALYTIC ACTIVITY: ATP + H(2)O + H(+)(In) = ADP + phosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           "Mechanisms of evolution in Rickettsia conorii and R. prowazekii.";
Science 293:2093-2098 (2001).
-!- CATALYTIC ACTIVITY: S-adenosyl-L-methionine + 3-
demethylubiquinone-9 = S-adenosyl-L-homocysteine + ubiquinone-9.
-!- PATHWAY: Ubiquinone biosynthesis
-!- SIMILARITY: BELONGS TO THE UBIG/COQ3 FAMILY.
-!- SIMILARITY: CONTAINS I RPEI INSERT DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                              SEQUENCE FROM N.A.

Kato C., Smorawinska M., Li L., Horikoshi K.;
"Comparison of the gene expression of aspartate beta-D-semialdehyde dehydrogenase at elevated hydrostatic pressure in deep-sea bacteria.";
J. Blochem. 121:717-723 (1997).
-!- CATALYTIC ACTIVITY: L-aspartate-4-semialdehyde + phosphate +
NADP(+) = L-4-aspartyl phosphate + NADPH.
-!- PATHWAY: SECOND STEP IN THE COMMON BIOSYNTHETIC PATHWAY LEADING
FROM ASP TO THE CELL WALL PRECURSOR MESO-DIAMINOPIMELATE, TO LYS,
TO MET, TO ILE AND TO THR.
-!- SUBUNIT: HOMODIMER (BY SIMILARITY).

The Every Processor of The Replicative Synthesis in Bacteria.

The Bernorlon: DNA POLYMERASE III IS A COMPLEX, MULTICHAIN ENZYME

THIS DNA POLYMERASE ALSO EXHIBITS 3' TO 5' EXONUCLEASE ACTIVITY.

THE BETT CHAIN IS REQUIRED FOR INITIATION OF REPLICATION ONCE IT

IS CLAMPED ONTO DNA. IT SLIDES FREELY (BIDIRECTIONAL AND ATP-

TO INDEPENDENT) ALONG DUPLEX DNA.

"Comparison of dnaA nucleotide sequences of Escherichia coli,
"Comparison of dnaA nucleotide sequences of Escherichia coli,
salmonalla typhimurium, and Serratia marceacens.";
J. Bacteriol. 169:3976-3981(1987).

-i- FUNCTION: DNA POLYMERASE III IS A COMPLEX, MULTICHAIN ENZYME
RESPONSIBLE FOR MOST OF THE REPLICATIVE SYNTHESIS IN BACTERIA.
THIS DNA POLYMERASE ALSO EXHIBITS 3' TO 5' EXCONDULBASE ACTIVITY.
THE BETA CHAIN IS REQUIRED FOR INITIATION OF REPLICATION ONCE IT
IS CLANDED ONTO DNA, IT SLIDES FREELY (BIDIRECTIONAL AND ATP-
INDEPRNDENT) ALONG DUPLEX DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Salmonella typhimurium.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CAUTION: THIS IS A CONCEPTUAL TRANSLATION; A FRAMESHIFT WAS INTRODUCED FROM POSITION 112-135 TO EXTEND THE SIMILARITY WITH THE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          UDDUDISHED OBSERVATIONS (JAN-2000).

-I- FUNCTION: THE B REGULATORY SUBUNIT MIGHT MODULATE SUBSTRATE SELECTIVITY AND FACTALITY, AND ALSO MIGHT DIRECT THE SELECTIVITY AND FACH SOME TO A PARTICULAR SUBCELLULAR COMPARTMENT. INTERACTS WITH CYCLIN G (IN VITRO).

-I- SUBUNIT: PP2A CONSISTS OF A COMMON HETERODIMERIC CORE ENZYME, COMPOSED OF A SE AD ACCOMONITY (SUBUNIT C) AND A 65 KDA CONSTANT REGULATORY SUBUNIT (RAS OF A SECULATORY SUBUNIT).

WITH A VARIETY OF REGULATORY SUBUNITS. PROTEINS THAT ASSOCIATE WITH THE CORE DIMER INCLUDE THREE FAMILLES OF REGULATORY SUBUNITS B (THE R2) FAPES SHESS), THE 48 KDB VARIABLE REGULATORY SUBUNITS, VIRAL PROTEINS, AND CELL SIGNALING MOLECULES.
                                                                       30-MAY-2000 (Rel. 39, Created)
30-MAY-2000 (Rel. 39, Last sequence update)
30-MAY-2000 (Rel. 39, Last sanctation update)
Serine/threonine protein phosphatase 2A, 56 kDa regulatory subunit, epsilon isoform (PSZA, B subunit, B epsilon isoform) (PPZA, B subunit, B subunit, B56 epsilon isoform) (PPZA, B subunit, RF subunit, R5 epsilon isoform) (PPZA, B subunit, R61 epsilon isoform) (PPZA, B subunit, R7 epsilon isoform)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                             Proc. Natl. Acad. Sci. U.S.A. 93:4638-4643(1996).
-!- FUNCTION: MAY SERVE AS "FLLIPPASE" AS WELL AS A GLUCOSYLTRANSFERASE
-!- THAT TRANSFERS GLUCOSE TO CERAMIDE.
-!- CATALYTIC ACTIVITY: UDP-glucose + N-acylsphingosine = UDP + D-
                                                                01-NOV-1997 (Rel. 35, Created)
01-NOV-1997 (Rel. 35, Last sequence update)
16-OCT-2001 (Rel. 40, Last annotation update)
Ceramide glucosyltransferase (EC 24.1.80) (Glucosylceramide synthase)
(GCS) (UDP-glucose:N-acylsphingosine D-glucosyltransferase) (GLCT-1).
                                                                                                                                                                                                                                                       SEQUENCE FROM N.A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cancer Res. 56:3855-3888(1996).

-!-FUNCTION: THE REGULATORY SUBUNIT MIGHT MODULATE SUBSTRATE
SELECTIVITY AND CATALYTIC SCTIVITY, AND ALSO MIGHT DIRECT THE
LOCALIZATION OF THE CATALYTIC ENZYME TO A PARTICULAR SUBCELLULAR
COMPARIMENT. INTERACTS WITH CYCLIN G IN VITRO.

-!- SUBUNIT: PP2A CONSISTS OF A COMMON HETERODIMERIC CORE ENZYME,
COMPOSED OF A 36 KDA CATALYTIC SUBUNIT (SUBUNIT C) AND A 65 KDA
CONSTANT REGULATORY SUBUNIT (PRES OR SUBUNIT A), THAT ASSOCIATES
WITH A VARIETY OF REGULATORY SUBUNITS. PROTEINS THAT ASSOCIATE
B (THE RZ)AP/RES/BSS, R3/B', PR72/PR130/PRS9 AND RS/B'/BS6
FAMILIES), THE 48 KDA WARLABLE REGULATORY SUBUNIT, VIRAL PROTEINS,
AND CELL SIGNALING MOLECULES.
-!- SUBCELLULAR LOCATION: CYCOPIASMIC (By similarity).
-!- TISSUE SPECIFICITY: HIGHEST LEVELS IN HEART,LIVER AND BRAIN. LOWER
LEVELS IN SKELETAL MUSCLE, SPLEEN, KIDNEY, AND LUNG.
-!- SIMILARITY: BELONGS TO THE PHOSPHATASE 2A REGULATORY SUBUNIT B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This SWISS-PROT entry is copyright. CC -1- FUNCTION: PIBRONECTINS BIND CELL SURFACES AND VARIOUS COMPOUNDS

CC -1- FUNCTION: PIBRONECTIN BIND CELL SHAPE.

CC -1- FUNCTION: VARIANT (V+C)- IS PROBABLY INVOLVED IN MATRIX

ORGANIZATION OF CARTILAGE.

CC -1- SUBDNITS MOSTLY HETERODIMERS OR MULTIMERS OF ALTERNATIVE SPLICED

VARIANTS, CONNECTED BY 2 DISULFIDE BONDS NEAR THE CARBOXYL ENDS;

CC -1- SUBDNITS CONNECTED BY 2 DISULFIDE BONDS NEAR THE CARBOXYL ENDS;

CC -1- ALTERNATIVE PRODUCTS: EACH OF THE "EXTRA DOMAIN" & THE CONNECTING STRAND 3 ARE PRESENT IN SOME FORMS OF PIBRONECTIN AND ABSENT IN CV+C)- LACKS REPERAT 15 OF PIBRONECTIN TYPE-111, REPEAT 10 OF FIBRONECTIN TYPE-111, AND THE CONNECTING STRAND 3.

CC -1- TISSUE SPECIFICITY: PLASMA FN (SOLUBLE DIMERIC FORM) IN EXPERSION OF FIBRONECTIN TYPE-111, AND THE CONNECTING STRAND 3.

CC -1- TISSUE SPECIFICITY: PLASMA FN (SOLUBLE DIMERIC FORM), MADE BY FIBROHEASTS, RETHALLIAL AND OTHER CELL TYPES, IS CORNS), MADE BY FIBROHEASTS, RETHALLIAR MADOR TRANSCRIPT IN ARTICULAR CARTIAGE, VERY LOW LEVELS IN LYMPH NODE, BONE, AORTA, AND SKIN; ABSENT FROM LIVER, SPLEEN, CC INTERNATIVE, AND TRANSCRIPT IN ARTICULAR CARTIAGE, VERY LOW LEVELS IN LIVERH NODE, BONE, AORTA, AND SKIN; ABSENT FROM LIVER, SPLEEN, CC INTERNATIVE, AND THE CONTAINS.

CC -1- TISSUE SPECIFICITY: PLASMA FN (SOLUBLE DIMERIC FORM).

CC -1- TISSUE SPECIFICITY: PLASMA FN (DIMERIC STRAND CONTAINS, AND STRAND ABSENT THE CONTAINS AT LEAST 4 FIBRONECTIN TYPE IID DOMAINS.

CC -1- TISSUE SPECIFICITY.

CC -1- TISSUE SPECIFICITY.

CC -1- TISSUE SPECIFICITY.

CC -1- TISSUE SPECIFICITY: PLASMA FN (DIMERIC STRAND CONTAINS).

-!- CATALYTIC ACTIVITY: ATP + L-methionine + tRNA (Met) = AMP + diphosphate + L-methionyl-tRNA (Met).
-!- COFACTOR: BINDS 1 ZINC ION (BY SIMILARITY).
-!- SUBGELIUAR LOCATION: CYFOPLASMIC.
-!- SIMILARITY: BELONGS TO CLASS-1 AMINOACYL-TRNA SYNTHETASE FAMILY.
STRONG, TO CYSTEINYL-TRNA SYNTHETASE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Shirai M., Hirakwa H., Kimoto M., Tabuchi M., Kishi F., Ouchi K., Shiba T., Ishii K., Hattori M., Kuhara S., Nakazawa T.; Couchi K., Hattori M., Kuhara S., Nakazawa T.; Comparison of whole genome sequences of Chlamydia pneumoniae J138 from Japan and CW1029 from USA.", Nucleic Acids Res. 28:2311-2314(2000).

-I-PUNCTION: IT IS PROBABLY ESSENTIAL FOR CELL SURVIVAL, BEING REQUIRED NOT ONLY FOR ELONGATION OF PROTEIN SYNTHESIS BUT ALSO FOR THE INITIATION OF ALL MRNA TRANSLATION THROUGH INITIATOR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           STRAIN=CWL029;

WITH THE CORE DIMER INCLUDE THREE FAMILIES OF REGULATORY SUBUNITS
B (THE R2/B/PR55/B55, R3/B''/PR72/PR130/PR59 AND R5/B'/B56
FAMILIES), THE 48 KDA VARIABLE REGULATORY SUBUNIT, VIRAL PROTEINS,
AND CELL SIGNALING MOLECULES (By similarity).
-!- SUBCELLULAR LOCATION: Nuclear (By similarity).
-!- TISSUE SPECIFICITY: HIGHLY EXPRESSED IN BRAIN.
-!- SIMILARITY: BELONGS TO THE PHOSPHATASE 2A REGULATORY SUBUNIT B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SH3 BINDING, CLASS I (POTENTIAL).
NUCLEAR LOCALIZATION SIGNAL (POTENTIAL)

COMPOSED OF A 36 kDa CATALYTIC SUBUNIT (SUBUNIT C) AND A 65 kDa
CONSTANT REGULATORY SUBUNIT (PR65 OR SUBUNIT A), THAT ASSOCIATES
WITH A VARIETY OF REGULATORY SUBUNITS. PROTEINS THAT ASSOCIATE
WITH THE CORE DIMER INCLUDE THREE FAMILIES OF REGULATORY SUBUNITS
B (THE R2/B/PR55/B55, R3/B''/PR72/PR130/PR59 AND R5/B'/B56
FAMILIES), THE 48 kDa VARIABLE REGULATORY SUBUNIT, VIRAL PROTEINS,
AND CELL SIGNALING MOLECULES.
SUBGELJULAR LOCATION: CYTOPLASMIC AND NUCLEAR IN INTERPHASE,
NUCLEAR DURING MITOSIS.
                                                                                                                                                                                                                                                                                                                                                                                                                             Strausberg R.; Substraint of the EMBL/GenBank/DDBJ databases. Submitted (JUL-2001) to the EMBL/GenBank/DDBJ databases. -!- PUNCTION: THE B REGULATORY SUBMIT MIGHT MODULATE SIBLECTIVITY AND CATALYTIC ACTIVITY, AND ALSO MIGHT DIRECT THE LOCALIZATION OF THE CATALYTIC ENZYME TO A PARTICULAR SUBCELLULAR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ALTERNATIVE PRODUCTS: 3 ISOFORMS; DELTA-1 (SHOWN HERE), DELTA-2
AND DELTA-3; ARE PRODUCED BY ALTERNATIVE SPLICING.
TISSUE SPECIFICITY: ISOFORM DELTA-2 IS WIDELY EXPRESSED. ISOFORM
DELTA-1 IS HIGHLY EXPRESSED IN BEARA.
INDUCTION: BY RETINOIC ACID; IN NEUROBLASTOMA CELL LINES.
PTM: AT LEAST ISOFORM DELTA-1 IS PHOSPHORYLATED ON SERINE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SH3 BINDING, CLASS I (POTENTIAL).

Nucleic Acids Res. 28:4317-4331(2000).

-- FUNCTION: THE REACTION CATALYZED BY TOPOISOMERASES LEADS TO THE CONVERSION OF OWER TOPOLOGICAL ISOMER OF DNA TO ANOTHER.

-- CATALYTIC ACTIVITY: ATP-independent breakage of single-stranded DNA, followed by passage and rejoining.

-- SUBUNI: MONOMER (BY SIMILARITY).

-- MISCELLANEOUS: WHEN A TOPOISOMERASE TRANSIENTLY BREAKS A DNA BACKBONE BOND, IT SIMULARITYD.

WHICH A TYROSYL OXYGEN IN THE SEXTME IS JOINED TO A DNA PHOSPHORUS AT ONE END OF THE ENZYME-SEVERED DNA STRAND.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

-!- FUNCTION: Cooperates with MD-2 and TLR6 to mediate the innate immune response to bacterial lipoproteins and other microbial cell wall components. Acts via MyD88 and TRR6, leading to NF-kappa-B activation, cytokine secretion and the inflammatory response. May also promote apoptosis in response to lipoproteins (By

```

```
response to bacterial lipoproteins and other microbial cell wall response to bacterial lipoproteins and other microbial cell wall components. Acts via MyD88 and TRAF6, leading to NF-Kappa-B activation, cytokine secretion and the inflammatory response. May also promote apoptosis in response to lipoproteins. Recognizes mycoplasmal macrophage-activating lipopeptide-kD (MALP-2), soluble tuberculosis factor (STF), phenol-soluble modulin (PSM) and B.burgdorferi outer surface protein A lipoprotein (OspA-L) cooperatively with TLR6.

-: SUBUNTT: Binds MD-2 and TLR6 via the extracellular domain. Binds MyD88 via their respective TIR domains.

-: SUBUNTT: Binds MD-2 and TLR6 via the extracellular domain. Binds LUCATION: Type I membrane protein (By similarity).

-: SUBCELLULAR LOCATION: Type I membrane protein lood and in spleen. Also detected in lung and in fetal liver. Levels are low in other tissues.

-: SIMILARITY: CONTAINS 10 THE TOLL-LIKE RECEPTOR FAMILY.

-: SIMILARITY: CONTAINS 11 TIR DOMAIN.

-: SIMILARITY: CONTAINS 11 TIR DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    between the Swiss Institute of Bioinformatics and the EMBL outstation - the Buropean Bioinformatics Institute. Immunol. 167:987-994(2001).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            FUNCTION: Participates in the innate immune response to Grampositive bacteria and fungi. Acts via MyD88 and TRAF6, leading to NF-kappa-B activation, cytokine secretion and the inflammatory response. Recognizes mycoplasmal macrophage-activating lipopeptide-2kD (MALP-2), soluble tuberculosis factor (STF), phenol-soluble modulin (FSM) and B.burgdorferi outer surface protein A lipoprotein (OSPA-L) cooperatively with TLR2. SUBUNIT: Binds TLR2 via their respective extracellular domains.

Binds MyD88 via their respective TIR domains (By similarity).

-!- SUBCELLULAR LOCATION: Type I membrane protein. Plasma membrane and phagosomes (By similarity).

-!- TISSUE SPECIFICITY: Detected in monocytes, CD11c+ immature dendritic cells, plasmacytoid pre-dendritic cells and dermal microvessel endothelial cells.
-!- SIMILARITY: BELONGS TO THE TOLL-LIKE RECEPTOR FAMILY.
-!- SIMILARITY: CONTAINS 1 TIR DOMAIN.
-!- SIMILARITY: CONTAINS 13 LEUCINE-RICH REPEATS (LRR).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Science 281:375-388(1998).
-!- FUNCTION: DEGRADES SHORT-LIVED REGULATORY AND ABNORMAL PROTEINS IN
PRESENCE OF ATP. HYDROLYZES TWO ATPS FOR EACH PEPTIDE BOND CLEAVED
IN THE PROTEINS UBSTRATE (BY SIMILIARITY).
-!- CATALYTIC ACTIVITY: HYDROLYSIS Of large proteins such as globin,
casein and denaturated serum albumin, in presence of ATP.
-!- SUBDINT: HONOTERTAMER (BY SYMILIARITY).
-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-!- SIMILARITY: BELONGS TO PEPTIDASE PAMILY $16.
                                                                                                                                                                                                                                                                                                                                  STRAIN-Nichols,

PROTEIN THAT MAY PLAY A ROLE IN ORGANELLE TRANSPORT.

-- SUBUNIT: OLIGOMER COMPOSED OF TWO HEAVY CHAINS AND TWO LIGHT CHAINS (BY STMILARITY).

-- SUBCELLULAR LOCATION: CONCENTRATED IN THE CELL BODY OF THE NEURONS, PARTICULARLY IN THE PERINUCLEAR REGION.

-- DOMAIN: COMPOSED OF THREE STRUCTURAL DOWAINS: A LARGE GLOBULAR N-TERMINAL DOMAIN WHICH IS RESPONSIBLE FOR THE MOTOR ACTIVITY OF KINESIN (IT HYDROLYZES APP AND BINDS MICROTUBLIE), A CENTRAL ALPHA-HELICAL COILED COIL DOMAIN THAT MEDIATES THE HEAVY CHAIN DIMERIZATION; AND A SMALL GLOBULAR C-TERMINAL DOMAIN WHICH INTERACTS WITH OTHER PROTEINS (SUCH AS THE KINESIN LIGHT CHAINS), VESICLES AND MEMBERANGO SRGANELLES.

-- SIMILARITY: BELONGS TO THE KINESIN-LIKE PROTEIN FAMILY. KINESIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Сарв

TISSUE SPECIFICITY: DISTRIBUTED THROUGHOUT THE CNS BUT IS HIGHLY ERRICHED IN SUBSETS OF NEURONS.

DOWAIN: COMPOSED OF THREE STRUCTURAL DOMAINS: A LARGE GLOBULAR N-TERMINAL DOMAIN WHICH IS RESPONSIBLE FOR THE MOTOR ACTIVITY OF KINESIN (IT HYDROLYZES ATP AND BINDS MICROTUBLE), A CENTRAL ALPHA-HELICAL COLLED COIL DOMAIN THAT MEDIATES THE HEAVY CHAIN DIMERIZATION; AND A SMALL GLOBULAR C-TERMINAL DOMAIN WHICH INTERACTE WITH OTHER PROTEINS (SUCH AS THE KINESIN LIGHT CHAINS),
                                                                                      01-NOV-1997 (Rel. 35, Created)
01-NOV-1997 (Rel. 35, Last sequence update)
16-OCT-2010 (Rel. 40, Last annotation update)
Neuronal kinesin heavy chain (NKHC) (Kinesin heavy chain isoform 5A)
(Kinesin heavy chain neuron-specific 1).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SIMILARITY: BELONGS TO THE KINESIN-LIKE PROTEIN FAMILY.
